

Term Project Prototype Software Demo

[YOUR TEAM NAME]

[TEAM MEMBER NAMES]

[DATE]

Main Webpage Overview

- To prepare for your software prototype demo, you are required to include a screenshot of the main webpage of your developed website in this presentation slide.
- This screenshot will serve to visually showcase the design, layout, and key features of your project, providing the audience with a clear understanding of your prototype.
- Ensure the screenshot captures the core elements of the page and is neatly integrated into your slides as part of your project deliverables.

Project Overview

- Brief summary and description of the term project application
- A brief description of an application framework, libraries, database, tools, and a programming language your team uses.

Project Overview

- As you prepare for your prototype software demo, this slide summarizes the progress made so far in developing your application. Here's a breakdown of the key components, which will form the core of your term project.
- Application Framework:
 - Your team has selected and implemented an application framework that acts as the backbone of your project. Be sure to mention how your framework supports the overall structure of your application and facilitates key features like routing, user interactions, or data handling.
- Libraries and APIs:
 - To extend your application's capabilities, your team has integrated libraries and APIs. These tools allow you to avoid reinventing the wheel by providing pre-built functions and resources. Be sure to mention how these libraries enhance your application's functionality, whether it's for data processing, machine learning, or UI components.
- Database:
 - Your team has set up a database to store, manage, and retrieve data. It's crucial that your database design is well-organized and supports the core functionality of your application. In the demo, highlight how the database handles data storage and retrieval, ensuring smooth performance and data integrity within your application.
- Tools:
 - The development tools used throughout your project help manage code, facilitate collaboration, and ensure quality. For example, you may have used an IDE like Visual Studio Code for writing your code, and Git for version control to ensure the correctness of your application. Be sure to mention how these tools have streamlined development, supported teamwork, and contributed to maintaining high-quality code.
- Programming Language:
 - The programming language chosen for your project plays a key role in implementing the features and functionality of your application. Depending on your project type, your team might have used Python for backend logic or machine learning, JavaScript for front-end interactivity, or Java for building robust, scalable applications. In your presentation, explain why your chosen language best aligns with your project's goals and how it optimizes the performance and scalability of your application.

Demo

- Demo Instructions
- Step 1
 - Demonstrate how your application works in a web browser.
 - Show the basic core features in this prototype demo. (Full functionalities will be presented in the final demo.)
 - It is highly recommended to use a PC in the classroom. (Bringing your laptop for the demo is an option if necessary.)
- Step 2
 - Show how your team manages the project schedule using a project management tool (e.g., Pivotal Tracker).
 - Demonstrate how your team maintains software changes using a version control system (e.g., GitHub).
